

## OVERVIEW ON UNIT OF MEASURE CONVERSION FACTOR

The **Unit of Measure Conversion Factor** is used to convert products ordered by a case/box to individual stocking units. To set a product with **Unit of Measure Conversion factor** submit a help ticket and the Customer Success team will assist with updating the product settings. Once the setup is complete, the product can be ordered by case. The steps below are an overview of the workflow when ordering a product set with a **Unit of Measure Conversion**.

In this example, the crutches are ordered in a case of 2 therefore, the **Unit of Measurement (UoM)** set for 1 case of crutches equals 2 individual stocking units.

Unit of Measurement

Vendor Unit of Measure	Conversion Factor
1 Case (EA)	= 2 Stocking Units
(e.g. 1 CASE = 24 Stocking Units (EA))	

The Par level for products ordered by case should be set to the minimum amount of product on-hand until additional inventory is delivered to meet demand. The Par Level and On Hand level are displayed as single dispensing items even though a restock is set to order via a case.
